Southeast University

# ALGORITHMS AND FLOWCHARTS

- A typical programming task can be divided into two phases:
- **Problem solving phase**
  - produce an ordered sequence of steps that describe solution of problem
  - this sequence of steps is called an **algorithm**
- **Implementation phase**
  - implement the program in some programming language

# Steps in Problem Solving

- First produce a general algorithm (one can use **pseudocode**)
- Refine the algorithm successively to get step by step detailed **algorithm** that is very close to a computer language.
- **Pseudocode** is an artificial and informal language that helps programmers develop algorithms. Pseudocode is very similar to everyday English.

# Pseudocode & Algorithm

- **Example 1:** Write an algorithm to determine a student's final grade and indicate whether it is passing or failing. The final grade is calculated as the average of four marks.

# Pseudocode & Algorithm

## **Pseudocode:**

- *Input a set of 4 marks*
- *Calculate their average by summing and dividing by 4*
- *if average is below 50*  
    *Print "FAIL"*  
    *else*  
        *Print "PASS"*

# Pseudocode & Algorithm

- Detailed Algorithm

- Step 1:     Input M1,M2,M3,M4
- Step 2:      $\text{GRADE} \leftarrow (M1+M2+M3+M4)/4$
- Step 3:     if (GRADE < 50) then  
                    Print "FAIL"  
          else  
                    Print "PASS"  
          endif

# The Flowchart

- (Dictionary) A schematic representation of a sequence of operations, as in a manufacturing process or computer program.
- (Technical) A graphical representation of the sequence of operations in an information system or program. Information system flowcharts show how data flows from source documents through the computer to final distribution to users. Program flowcharts show the sequence of instructions in a single program or subroutine. Different symbols are used to draw each type of flowchart.

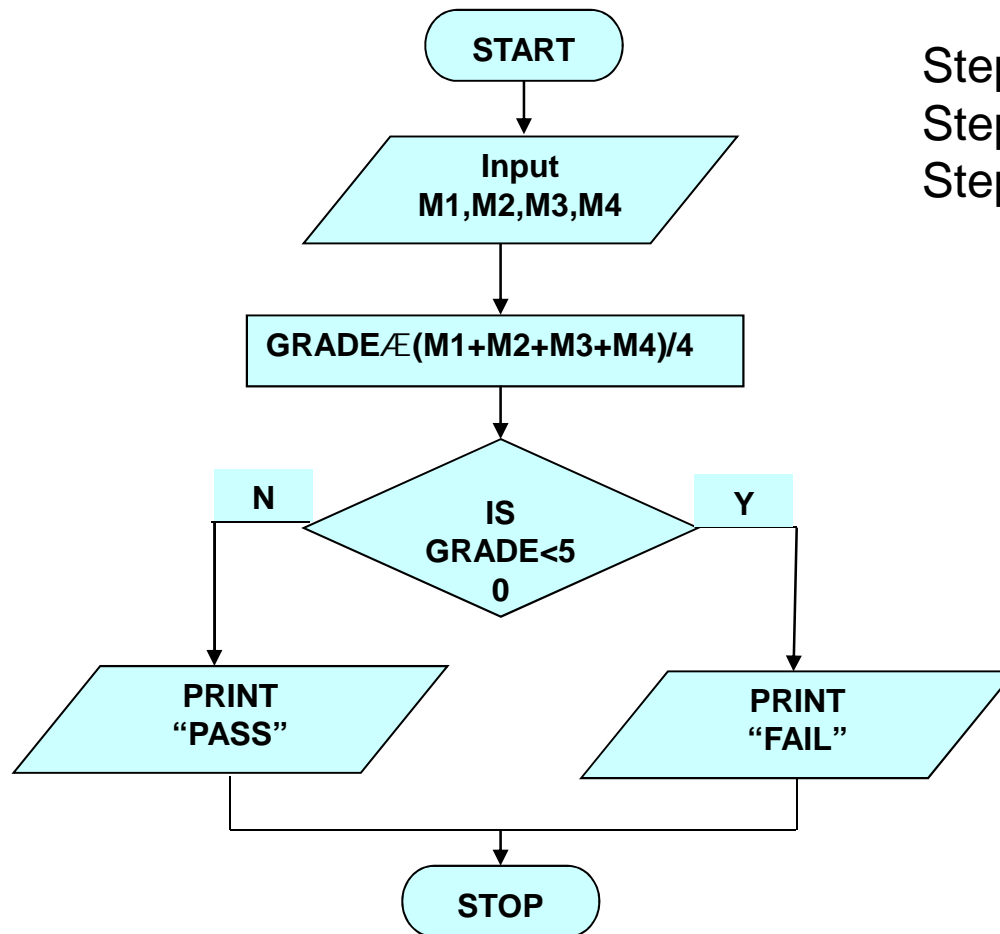

# The Flowchart

## A Flowchart

- shows logic of an algorithm
- emphasizes individual steps and their interconnections
- e.g. control flow from one action to the next

# Example

Step 1: Input M1,M2,M3,M4  
Step 2:  $GRADE \leftarrow (M1 + M2 + M3 + M4) / 4$   
Step 3: if (GRADE < 50) then  
          Print "FAIL"  
          else  
              Print "PASS"  
          endif

## Example 2

- Write an algorithm and draw a flowchart to convert the length in feet to centimeter.

### **Pseudocode:**

- *Input the length in feet (Lft)*
- *Calculate the length in cm (Lcm) by multiplying LFT with 30*
- *Print length in cm (LCM)*

# Example 2

## Algorithm

- Step 1: Input Lft
- Step 2:  $Lcm \leftarrow Lft \times 30$
- Step 3: Print Lcm

## Flowchart

## Example 3

**Write an algorithm and draw a flowchart that will read the two sides of a rectangle and calculate its area.**

### **Pseudocode**

- *Input the width ( $W$ ) and Length ( $L$ ) of a rectangle*
- *Calculate the area ( $A$ ) by multiplying  $L$  with  $W$*
- *Print  $A$*

# Example 3

## Algorithm

- Step 1: Input W,L
- Step 2:  $A \leftarrow L \times W$
- Step 3: Print A

## Example 4

- Write an algorithm and draw a flowchart that will calculate the roots of a quadratic equation  $ax^2 + bx + c = 0$
- Hint: **d** = sqrt (  $b^2 - 4ac$  ), and the roots are:  
**x1** =  $(-b + d)/2a$  and **x2** =  $(-b - d)/2a$

# Example 4

## **Pseudocode:**

- *Input the coefficients ( $a$ ,  $b$ ,  $c$ ) of the quadratic equation*
- *Calculate  $d$*
- *Calculate  $x_1$*
- *Calculate  $x_2$*
- *Print  $x_1$  and  $x_2$*

# Example 4

## ■ Algorithm:

- Step 1: Input a, b, c
- Step 2:  $d \leftarrow \text{sqrt}(b \times b - 4 \times a \times c)$
- Step 3:  $x_1 \leftarrow (-b + d) / (2 \times a)$
- Step 4:  $x_2 \leftarrow (-b - d) / (2 \times a)$
- Step 5: Print x1, x2

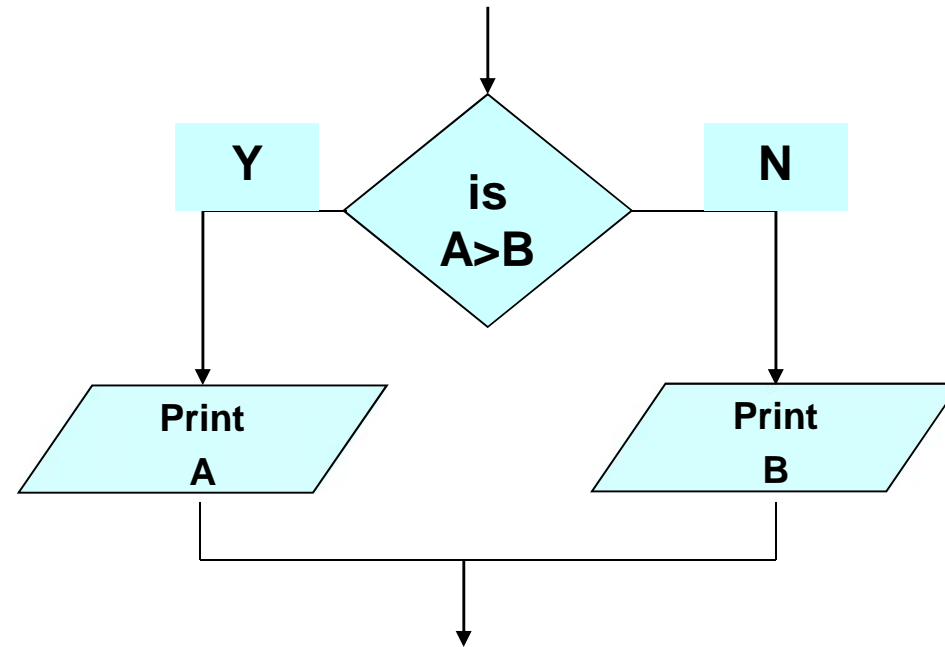

# DECISION STRUCTURES

- The expression  $A > B$  is a logical expression
- *it describes a **condition** we want to test*
- **if  $A > B$  is true (if A is greater than B)** *we take the action on left*
- print the value of A
- **if  $A > B$  is false (if A is not greater than B)** *we take the action on right*
- print the value of B

# DECISION STRUCTURES

# IF-THEN-ELSE STRUCTURE

- The structure is as follows

**If condition then**

**true alternative**

**else**

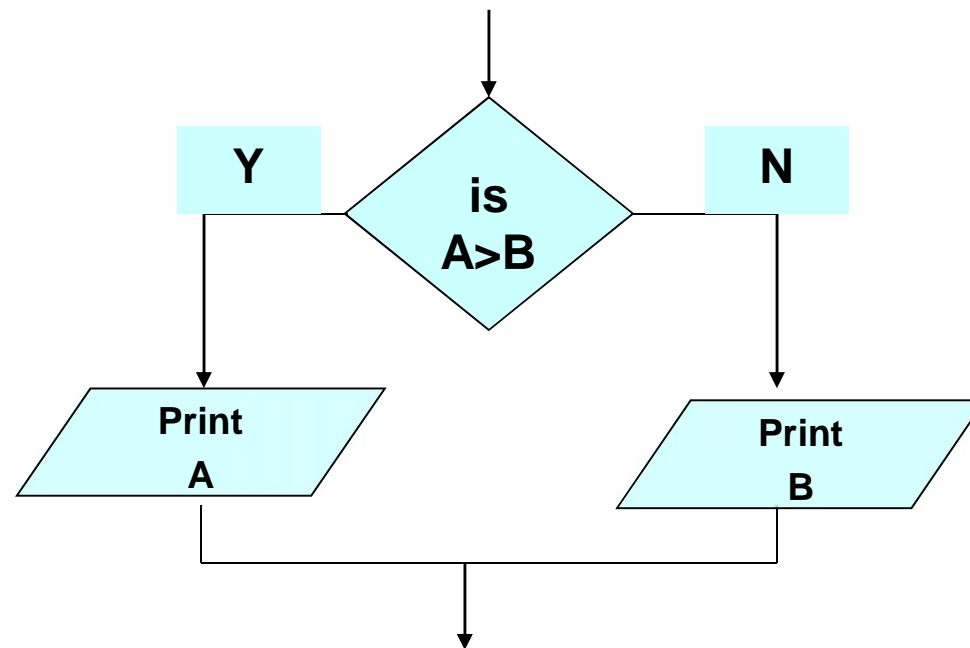

**false alternative**

**endif**

# IF-THEN-ELSE STRUCTURE

- The algorithm for the flowchart is as follows:

**If  $A > B$  then  
    print A  
else  
    print B  
endif**

# Relational Operators

Relational Operators	
Operator	Description
>	Greater than
<	Less than
=	Equal to
≥	Greater than or equal to
≤	Less than or equal to
≠	Not equal to

# Example 5

- Write an algorithm that reads two values, determines the largest value and prints the largest value with an identifying message.

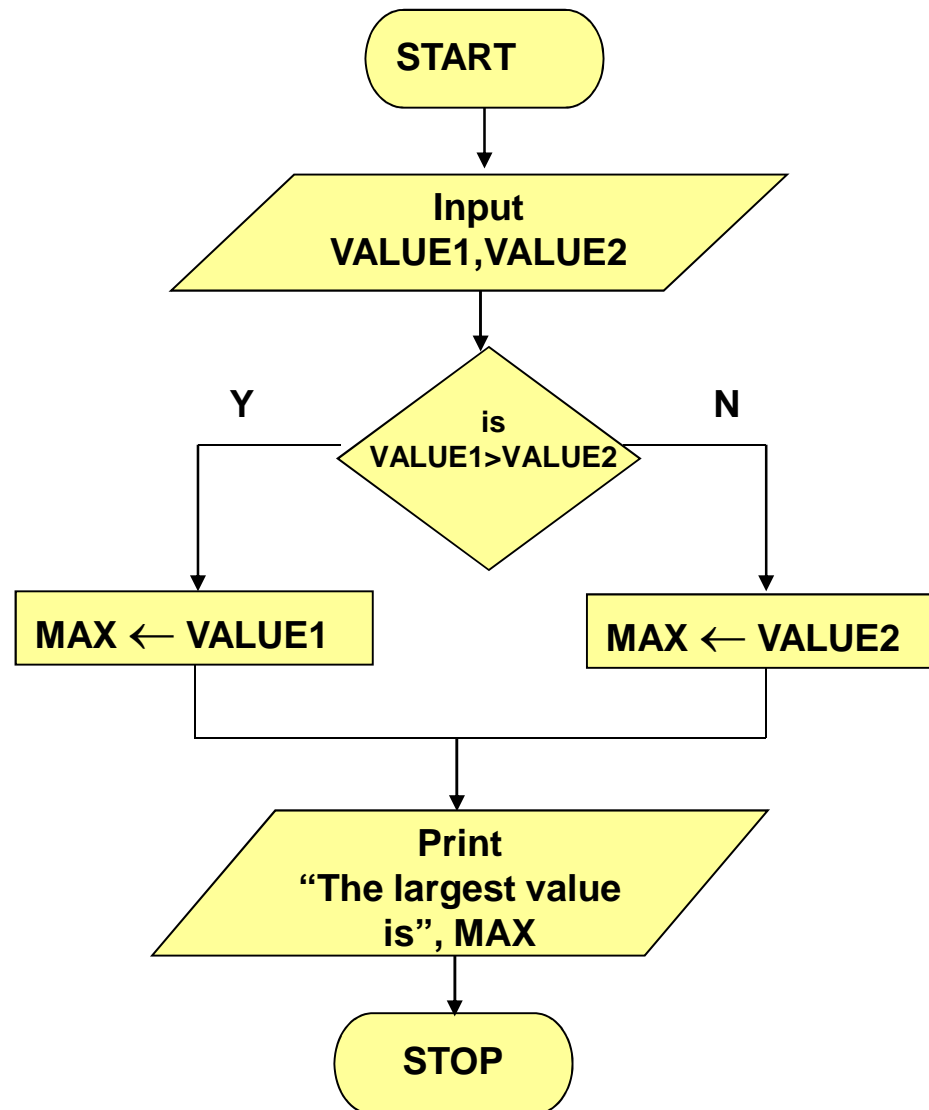

## **ALGORITHM**

Step 1:        *Input* VALUE1, VALUE2

Step 2:        *if* (VALUE1 > VALUE2) *then*  
                    MAX ← VALUE1  
                    *else*  
                    MAX ← VALUE2  
                    *endif*

Step 3:        *Print* “The largest value is”, MAX

# Example 5

# NESTED IFS

- One of the alternatives within an IF–THEN–ELSE statement
  - may involve further IF–THEN–ELSE statement

## Example 6

- Write an algorithm that reads **three** numbers and prints the value of the largest number.

# Example 6

**Step 1: Input N1, N2, N3**

**Step 2: if (N1>N2) then**

**if (N1>N3) then**

**MAX  $\leftarrow$  N1 [N1>N2, N1>N3]**

**else**

**MAX  $\leftarrow$  N3 [N3>N1>N2]**

**endif**

**else**

**if (N2>N3) then**

**MAX  $\leftarrow$  N2 [N2>N1, N2>N3]**

**else**

**MAX  $\leftarrow$  N3 [N3>N2>N1]**

**endif**

**endif**

**Step 3: Print “The largest number is”, MAX**

## Example 6

- **Flowchart: Draw the flowchart of the above Algorithm.**

# Example 7

- Write an algorithm and draw a flowchart to
  - a) read an employee name (NAME), overtime hours worked (OVERTIME), hours absent (ABSENT) and
  - b) determine the bonus payment (PAYMENT).

# Example 7

Bonus Schedule	
OVERTIME – $(2/3) \cdot \text{ABSENT}$	Bonus Paid
>40 hours	\$50
>30 but $\leq$ 40 hours	\$40
>20 but $\leq$ 30 hours	\$30
>10 but $\leq$ 20 hours	\$20
$\leq$ 10 hours	\$10

Step 1: *Input* NAME,OVERTIME,ABSENT  
Step 2: *if* (OVERTIME–(2/3)\*ABSENT > 40) *then*  
    PAYMENT ← 50  
    *else if* (OVERTIME–(2/3)\*ABSENT > 30) *then*  
        PAYMENT ← 40  
    *else if* (OVERTIME–(2/3)\*ABSENT > 20) *then*  
        PAYMENT ← 30  
    *else if* (OVERTIME–(2/3)\*ABSENT > 10) *then*  
        PAYMENT ←20  
    *else*  
        PAYMENT ← 10  
    *endif*  
Step 3: *Print* “Bonus for”, NAME “is \$”, PAYMENT

## Example 7

- **Flowchart: Draw the flowchart of the above algorithm?**
